## 1.1 Description

The `icikt` package handles missing data before calculating a correlation between datasets for variables. The missing values are treated as information from a left-centered distribution perspective and are included in the calculation of concordant and discordant pairs used in calculating the correlation value.

Full API documentation, user guide, and tutorial can be found on [readthedocs](#)

## 1.2 Installation

The `icikt` package runs under Python 3.4+. Use `pip` to install. Starting with Python 3.4, `pip` is included by default.

### 1.2.1 Install on Linux, Mac OS X

```
python3 -m pip install icikt
```

### 1.2.2 Install on Windows

```
py -3 -m pip install icikt
```

### 1.2.3 Upgrade on Linux, Mac OS X

```
python3 -m pip install icikt --upgrade
```

## 1.2.4 Upgrade on Windows

```
py -3 -m pip install icikt --upgrade
```

## 1.2.5 Get the source code

Code is available on GitHub: <https://github.com/MoseleyBioinformaticsLab/icikt>

To clone the repo, first make sure you have `git` installed:

```
git clone https://github.com/MoseleyBioinformaticsLab/icikt.git
```

## 1.2.6 Dependencies

The `icikt` package depends on several Python libraries:

- `docopt` for a command line interface.
- `scipy` and `numpy` for mathematical calculations.
- `Cython` for optimized performance.

NOTE- NumPy and Cython must be preinstalled in order for this package to work.

The `pip` command will install all dependencies automatically, but if you wish to install them manually, run the following commands:

- **docopt for a command line interface**

- To install the `docopt` Python library run the following:

```
python3 -m pip install docopt # On Linux, Mac OS X  
py -3 -m pip install docopt # On Windows
```

- **scipy for performing the kendall-tau calculations**

- To install the `scipy` Python library run the following:

```
python3 -m pip install scipy # On Linux, Mac OS X  
py -3 -m pip install scipy # On Windows
```

- **numpy for creating and modifying ndarrays of data**

- To install `numpy` run the following:

```
python3 -m pip install numpy # On Linux, Mac OS X  
py -3 -m pip install numpy # On Windows
```

- **Cython for the cythonized kendall\_dis method**

- To install the `Cython` Python library run the following:

```
python3 -m pip install Cython # On Linux, Mac OS X  
py -3 -m pip install Cython # On Windows
```

WARNING- If the following `pip` error message is generated, then the `python3-devel` package must be installed:

```
"fatal error: Python.h: No such file or directory"
```

## 1.3 Basic usage

To use the `icikt` package, input a 2d array with n columns each representing an array of data for a variable. The `iciktArray` will return two n x n 2d arrays for correlations and p-values. Each element will correspond to the result of a combination of two columns in the input array. `iciktArray` can also be called from the command-line interface given the file path for the data along with several optional parameters(more in docs/tutorial).

Running through command line :

```
icikt iciktArray /path/to/file.tsv --data-format=tsv --replace=None
```

Running through python script :

```
import numpy as np
import icikt

dataArray = np.genfromtxt('/path/to/file.tsv', delimiter="\t")
# or with random values
dataArray = numpy.random.randn(100, 2)

# running just 2 arrays with icikt
corr, pVal, tMax = icikt.icikt(dataArray[:,0], dataArray[:,1])

# running all combinations with iciktArray
scaled, corrRaw, pVals, tauMax = icikt.iciktArray(dataArray)
```

## DOCUMENTATION INDEX:

### 2.1 icikt

#### 2.1.1 Description

The `icikt` package handles missing data before calculating a correlation between datasets for variables. The missing values are treated as information from a left-centered distribution perspective and are included in the calculation of concordant and discordant pairs used in calculating the correlation value.

Full API documentation, user guide, and tutorial can be found on [readthedocs](#)

#### 2.1.2 Installation

The `icikt` package runs under Python 3.4+. Use `pip` to install. Starting with Python 3.4, `pip` is included by default.

##### Install on Linux, Mac OS X

```
python3 -m pip install icikt
```

##### Install on Windows

```
py -3 -m pip install icikt
```

##### Upgrade on Linux, Mac OS X

```
python3 -m pip install icikt --upgrade
```

## Upgrade on Windows

```
py -3 -m pip install icikt --upgrade
```

## Get the source code

Code is available on GitHub: <https://github.com/MoseleyBioinformaticsLab/icikt>

To clone the repo, first make sure you have `git` installed:

```
git clone https://github.com/MoseleyBioinformaticsLab/icikt.git
```

## Dependencies

### The `icikt` package depends on several Python libraries:

- `docopt` for a command line interface.
- `scipy` and `numpy` for mathematical calculations.
- `Cython` for optimized performance.

NOTE- NumPy and Cython must be preinstalled in order for this package to work.

The `pip` command will install all dependencies automatically, but if you wish to install them manually, run the following commands:

- **docopt for a command line interface**

- To install the `docopt` Python library run the following:

```
python3 -m pip install docopt # On Linux, Mac OS X  
py -3 -m pip install docopt # On Windows
```

- **scipy for performing the kendall-tau calculations**

- To install the `scipy` Python library run the following:

```
python3 -m pip install scipy # On Linux, Mac OS X  
py -3 -m pip install scipy # On Windows
```

- **numpy for creating and modifying ndarrays of data**

- To install `numpy` run the following:

```
python3 -m pip install numpy # On Linux, Mac OS X  
py -3 -m pip install numpy # On Windows
```

- **Cython for the cythonized kendall\_dis method**

- To install the `Cython` Python library run the following:

```
python3 -m pip install Cython # On Linux, Mac OS X  
py -3 -m pip install Cython # On Windows
```

WARNING- If the following pip error message is generated, then the `python3-devel` package must be installed:

```
"fatal error: Python.h: No such file or directory"
```

### 2.1.3 Basic usage

To use the `icikt` package, input a 2d array with n columns each representing an array of data for a variable. The `iciktArray` will return two n x n 2d arrays for correlations and p-values. Each element will correspond to the result of a combination of two columns in the input array. `iciktArray` can also be called from the command-line interface given the file path for the data along with several optional parameters(more in docs/tutorial).

Running through command line :

```
icikt iciktArray /path/to/file.tsv --data-format=tsv --replace=None
```

Running through python script :

```
import numpy as np
import icikt

dataArray = np.genfromtxt('/path/to/file.tsv', delimiter="\t")
# or with random values
dataArray = numpy.random.randn(100, 2)

# running just 2 arrays with icikt
corr, pVal, tMax = icikt.icikt(dataArray[:,0], dataArray[:,1])

# running all combinations with iciktArray
scaled, corrRaw, pVals, tauMax = icikt.iciktArray(dataArray)
```

## 2.2 The icikt API Reference

### 2.2.1 Python Information-Content-Informed Kendall Tau Correlation (ICIKT)

The icikt package provides a Python tool to calculate an information-content-informed Kendall Tau correlation coefficient between arrays, while also handling missing values or values which need to be removed.

`icikt.methods.icikt(x: ndarray, y: ndarray, perspective: str = 'global') → tuple`

Finds missing values, and replaces them with a value slightly smaller than the minimum between both arrays.

#### Parameters

- **x** – First array of data
- **y** – Second array of data
- **perspective** – perspective can be ‘local’ or ‘global’. Default is ‘global’. Global includes (NA,NA) pairs in the calculation, while local does not.

#### Returns

tuple with correlation, pvalue, and tauMax values

`icikt.methods.iciktArray(dataArray: ndarray, globalNA: float = 0, perspective: str = 'global', scaleMax: bool = True, diagGood: bool = True, includeOnly: Optional[tuple] = None) → tuple`

Calls iciKT to calculate ICI-Kendall-Tau between every combination of columns in the input 2d array, dataArray. Also replaces any instance of the globalNA in the array with np.nan.

#### Parameters

- **dataArray** – 2d array with columns of data to analyze
- **globalNA** – Optional value to replace with np.nan. Default is 0.
- **perspective** – perspective can be ‘local’ or ‘global’. Default is ‘global’. Global includes (NA,NA) pairs in the calculation, while local does not.
- **scaleMax** – should everything be scaled compared to the maximum correlation?
- **diagGood** – should the diagonal entries reflect how many entries in the sample were “good”?
- **includeOnly** – only run correlations of specified columns/combinations

#### Returns

tuple of the output correlations, raw correlations, pvalues, and max tau 2d arrays

Future Parameters: featureNA sampleNA

`icikt.kendall_dis.kendall_dis(x, y)`

## 2.3 The icikt Tutorial

### 2.3.1 Importing icikt package

If the `icikt` package is installed, it can be imported:

```
import icikt
```

### Using icikt in the command-line interface

The `iciktArray` function can be accessed from the command line interface:

Either the "icikt" command or "python3 -m icikt" can be used to run the command line interface.

```
> icikt.py -h
```

Usage:

```
icikt.py iciktArray <dataFilePath> [--data-format=<format>] [--replace=<globalNA>] [-  
-mode=<perspective>] [--scale=<scaleMax>] [--diag=<diagGood>]  
icikt.py -h | --help
```

Using a csv file with no global replace values:

```
icikt.py iciktArray test.csv --data-format=csv --replace=None
```

Using a tsv file with no global replace values:

```
icikt.py iciktArray test.tsv --data-format=tsv --replace=None
```

Using a csv file with 0 as the replace value:

```
icikt.py iciktArray test.csv --data-format=csv
```

Using a csv file in local mode with 0 as the replace value:

```
icikt.py iciktArray test.csv --mode=local --data-format=csv
```

### Using icikt in a Python script

Import numpy and icikt:

```
import numpy as np  
import icikt
```

Generate a numpy array from your data file:

```
dataArray = np.genfromtxt('path/to/file.tsv', delimiter='\t')
```

Call `iciktArray` on your `dataArray`, saving outputs to separate variables:

```
out, corr, pVal, tMax = icikt.iciktArray(dataArray)
print(out,corr,pVal,tMax,sep='\n\n')

# saving outputs to files
np.savetxt('outArray.csv', out, delimiter=',')
np.savetxt('corrArray.csv', corr, delimiter=',')
np.savetxt('pValArray.csv', pVal, delimiter=',')
np.savetxt('tMaxArray.csv', tMax, delimiter=',')
```
